SAFETY CHECK-OUT (US Model Only)

After correcting the original service problem, perform the following safety checks before releasing the set to the customer:

1. Check the area of your repair for unsoldered or poorly-soldered connections. Check the entire board surface for solder splashes and bridges.
2. Check the interboard wiring to ensure that no wires are "pinched" or contact high-wattage resistors.
3. Check that all control knobs, shields, covers, ground straps, and mounting hardware have been replaced. Be absolutely certain that you have replaced all the insulators.
4. Look for unauthorized replacement parts, particularly transistors, that were installed during a previous repair. Point them out to the customer and recommend their replacement.
5. Look for parts which, though functioning, show obvious signs of deterioration. Point them out to the customer and recommend their replacement.
6. Check the line cord for cracks and abrasion. Recommend the replacement of any such line cord to the customer.
7. Check the condition of the monopole antenna (if any).
Make sure the end is not broken off, and has the plastic cap on it. Point out the danger of impalement on a broken antenna to the customer, and recommend the antenna's replacement.
8. Check the B+ and HV to see they are at the values specified. Make sure your instruments are accurate; be suspicious of your HV meter if sets always have low HV.
9. Check the antenna terminals, metal trim, "metallized" knobs, screws, and all other exposed metal parts for AC leakage. Check leakage as described below.

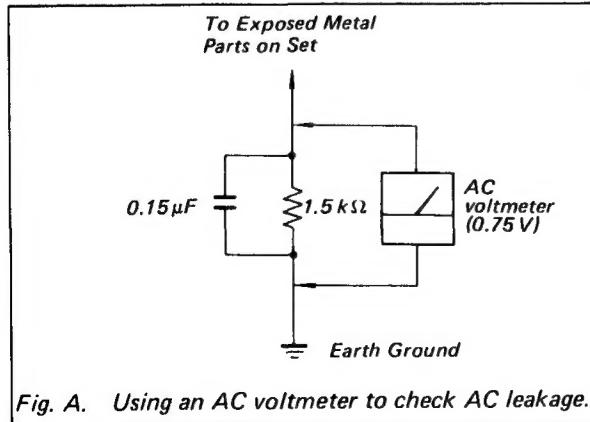

Fig. A. Using an AC voltmeter to check AC leakage.

LEAKAGE TEST

The AC leakage from any exposed metal part to earth ground and from all exposed metal parts to any exposed metal part having a return to chassis, must not exceed 0.5 mA (500 microampers). Leakage current can be measured by any one of three methods.

1. A commercial leakage tester, such as the Simpson 229 or RCA WT-540A. Follow the manufacturers' instructions to use these instruments.
2. A battery-operated AC milliammeter. The Data Precision 245 digital multimeter is suitable for this job.
3. Measuring the voltage drop across a resistor by means of a VOM or battery-operated AC voltmeter. The "limit" indication is 0.75 V, so analog meters must have an accurate low-voltage scale. The Simpson 250 and Sanwa SH-63Trd are examples of a passive VOM that is suitable. Nearly all battery operated digital multimeters that have a 2V AC range are suitable. (See Fig. A)

HOW TO FIND A GOOD EARTH GROUND

A cold-water pipe is guaranteed earth ground; the cover-plate retaining screw on most AC outlet boxes is also at earth ground. If the retaining screw is to be used as your earth-ground, verify that it is at ground by measuring the resistance between it and a cold-water pipe with an ohmmeter. The reading should be zero ohms. If a cold-water pipe is not accessible, connect a 60–100 watts trouble light (not a neon lamp) between the hot side of the receptacle and the retaining screw. Try both slots, if necessary, to locate the hot side of the line, the lamp should light at normal brilliance if the screw is at ground potential. (See Fig. B)

Connecting a VCR with an S video output jack

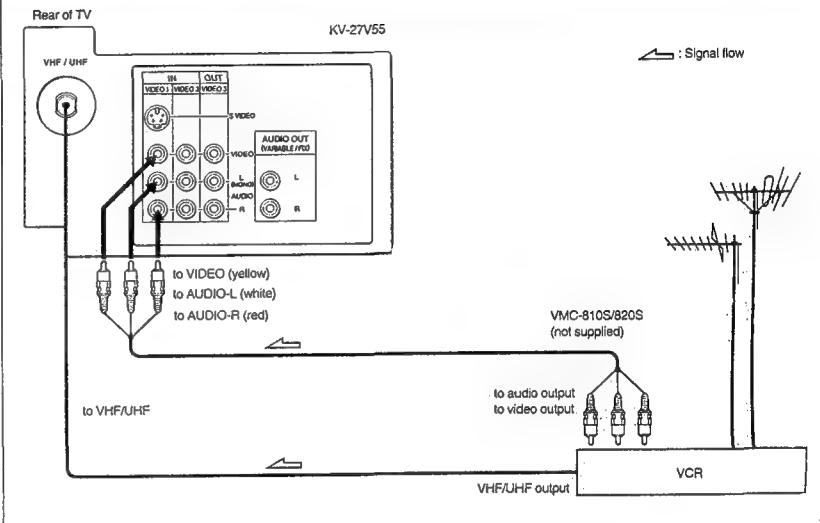

Notes

- If you connect a monaural VCR, connect the audio output of the VCR to the L (MONO) jack of VIDEO 1 IN on the TV. The monaural sound will be heard from both speakers.
- For operating instructions, refer to the instruction manual furnished with the VCR.
- If the picture or sound is affected, move the VCR away from the TV.
- If S VIDEO is set to OFF, you cannot watch VCR playback pictures from the S VIDEO IN. To set S VIDEO to ON, see "Watching a Video with Your S Video-Equipped VCR", p. 28.

About S video input

Video input and output signals can be separated into Y (luminance or brightness) and C (chroma or color) signals. Usually these two signals are combined in a VCR and sent as one signal to a TV. Separation of the Y and C signals prevents them from interfering with one another, thereby improving picture (especially color) quality. This TV is equipped with an S video input jack through which these separated signals can be input directly. This way you can connect your S video-equipped VCR separately from a non-S video VCR.

Connecting video equipment not equipped with an S video output jack

Preparing for use

- Turn on the TV.
- Press the TV/VIDEO button on the TV or on the Remote Commander so that VIDEO appears on the screen.

When you cannot obtain a clear picture and/or sound

2-9. REPAIR OF CHIP COMPONENT CIRCUIT BOARD

2-9-1. POINTS OF COMPONENT REMOVAL

Handling of blower type soldering iron

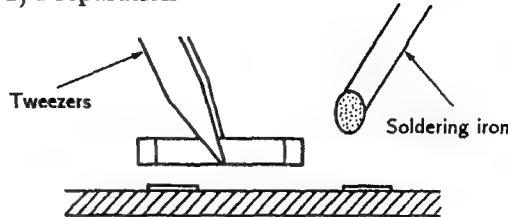

If hot blast is too strong or applied from a slanting direction, small components and solder near the component being removed can be blown off. Do not use blower type without temperature control.

2-9-2. NOTES ON SOLDERING FOR CHIP COMPONENTS

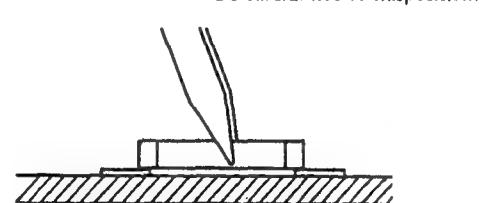

- 1) During soldering a chip component, if a soldering iron is applied for a long time, the heat may damage the component or cause pattern peeling.
- 2) Do not reuse a removed component. The characteristics of such a component may deteriorate.
- 3) Use wire solder containing silver ($\phi 0.3$ or $\phi 0.6$). (The pin electrodes of the laminated chip capacitor are silver + palladium, so if wire solder which does not contain silver is used, the silver of the pin electrode will be sucked into the solder.)

SOLDERING

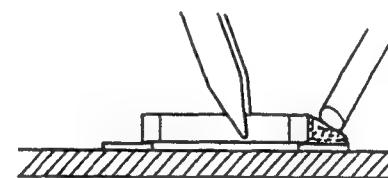

1) Preparation

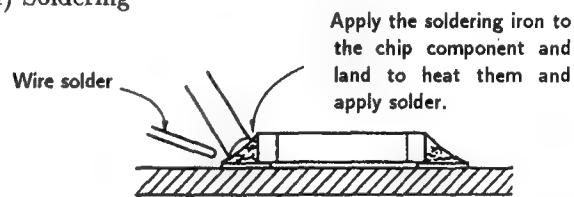

2) Location

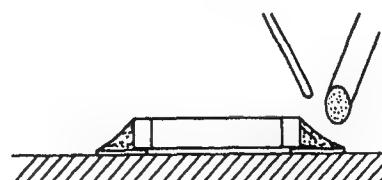

3) Tack soldering and flux application

4) Soldering

5) Soldering (Fix the fillet.)

6) Visual inspection

Check for the following defects :

- No-soldered part
- Bridge (to other components or lands)
- Mispositioning
- Other defects

2-9-3. REMOVAL AND MOUNTING OF COMPONENTS

Chip resistor and chip capacitor

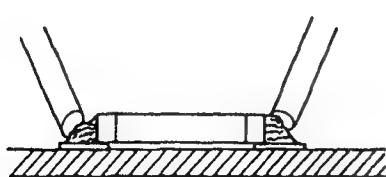

REMOVAL

• Using two soldering irons

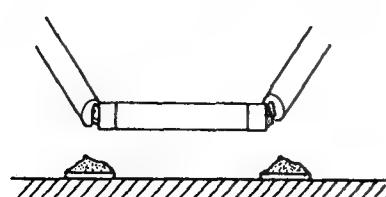

1) Mounted state

2) Melt the solder.

3) Remove the component.

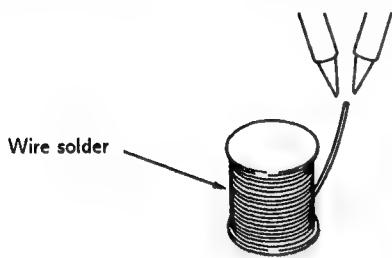

2-9-4. MINI-TRANSISTOR

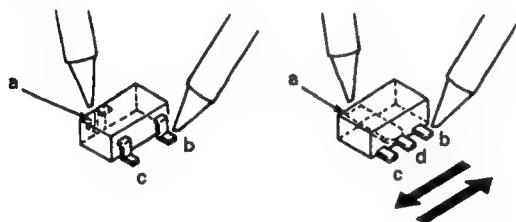

REMOVAL

- Using two soldering irons

1) Put a little solder on the tip of two soldering irons.

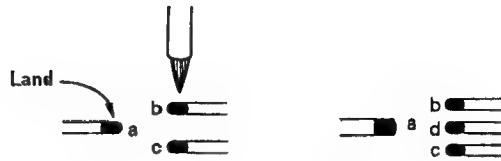

2) Apply the tip of one soldering iron to the point "a" and the other to the points "b" → "c" (or "b" → "d" → "c") and move the component in the directions indicated by arrows in the figure to remove it.

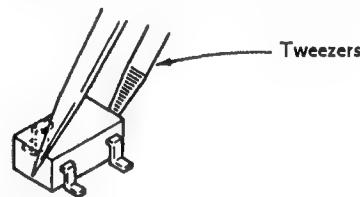

MOUNTING

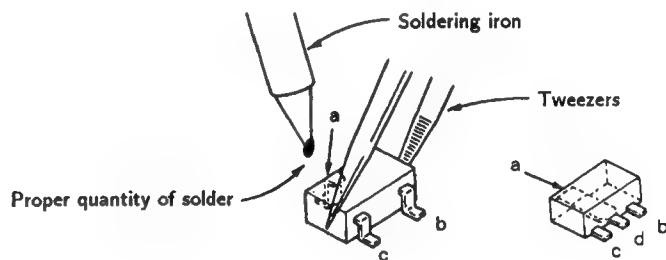

1) Apply a little flux to the land with a brush.

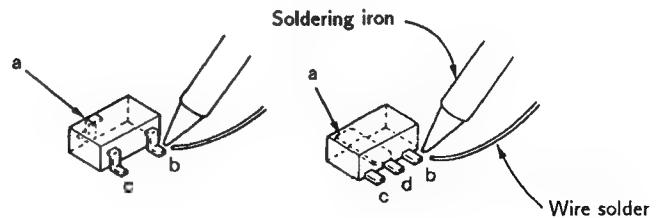

2) Place the component in position using tweezers.

3) Put a little solder on the tip of the soldering iron and solder the point "a" to fix the component.

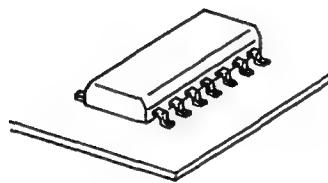

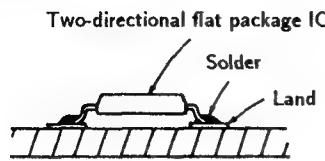

4) Bring the tip of the soldering iron and the wire solder close to the point to be soldered. Solder the points "b" → "c" (or "b" → "d" → "c") in order.

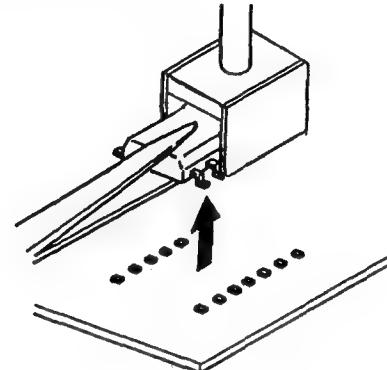

2-9-5. TWO-DIRECTIONAL FLAT PACKAGE IC

MOUNT CONDITION

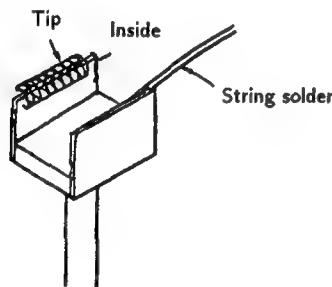

- When the solder melts, lift the IC with a pair of tweezers and remove.

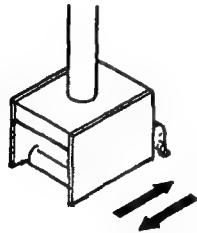

REMOVAL

- Apply some solder on the inside and the tip of the iron tip jig.

- Place the iron tip jig over the IC, and move the jig to and fro as shown in the figure.

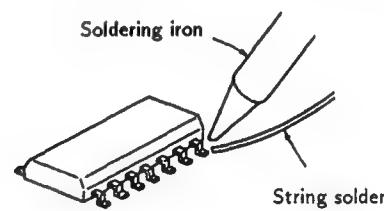

INSTALLATION

- Place the two-directional flat package IC at the appointed position, solder pins a and b on the diagonal, and fasten it.

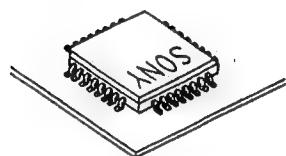

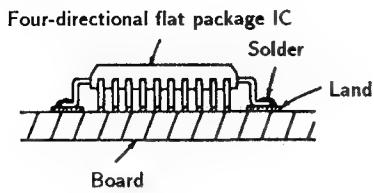

- Solder the remaining pins with the soldering iron.

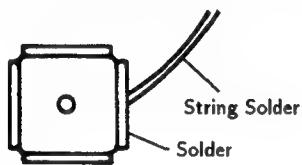

2-9-6. FOUR-DIRECTIONAL FLAT PACKAGE IC

MOUNT CONDITION

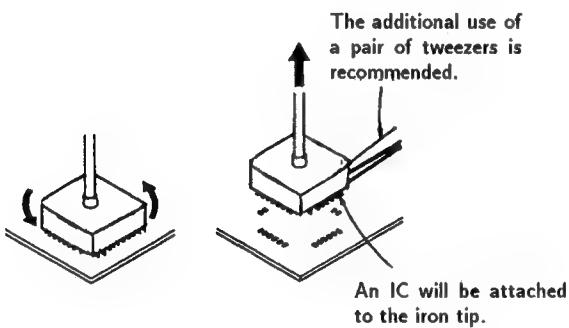

REMOVAL

- 1) Apply solder on the tip of the iron tip jig.

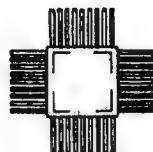

- 2) Place the iron tip jig over the IC, wait about two to three seconds, rotate the iron slightly and lift it up.

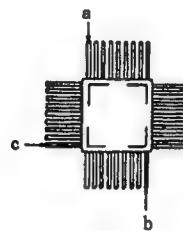

Note : For flat ICs of above 52P, the IC may not be completely attracted when the iron tip jig is lifted up. In these cases, use a pair of tweezers to remove.

INSTALLATION

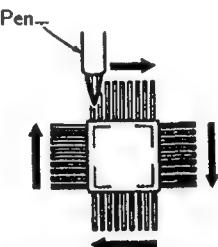

- 1) Place the four-directional flat package IC at the appointed position.

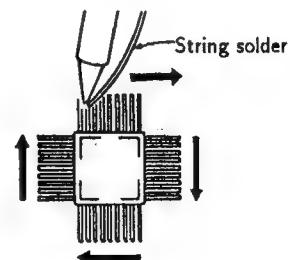

- 2) Apply a slight amount of solder on the iron tip, and solder the three sections in the order of a → b → c, and fix.

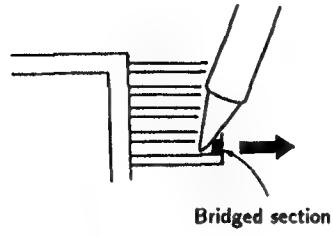

- 3) Apply a slight amount of flux with a pen on all four directions.

- 4) Apply solder on the iron tip and the string solder, and slide and solder in the directions of the arrows.

Note: 1) After soldering, if there are bridged sections, correct by sliding the soldering iron in the direction of the arrow.

If the bridges cannot be corrected using the above method, apply some flux with a pen and try again.

2) Soldering can be carried out more easily by sliding the iron tip near the tip of the IC leg. (Fig. A)

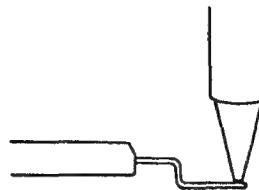

Fig. A

Be careful not to slide the bent sections of the leg as shown in Fig. B as soldering bridges will be formed.

SET-UP ADJUSTMENTS

- The following adjustments should be made when a complete realignment is required or a new picture tube is installed.
 - These adjustments should be performed with rated power supply voltage unless otherwise noted.

Controls and switch should be set as follows unless otherwise noted:

PICTURE control RESET
BRIGHTNESS control center

Preparations :

- In order to reduce the influence of geomagnetism on the set's picture tube face it east or west.
 - Switch on the set's power and degauss with the degausser.

3-1. BEAM LANDING

1. Input the white signal with the pattern generator.
Contrast }
Brightness } normal
 2. Set the pattern generator raster signal to green.
 3. Move the deflection yoke to the rear and adjust with the purity control so that the green is at the center and the blue and the red take up equally sized areas on each side.
(See Figures 3-1 through 3-3.)
 4. Move the deflection yoke forward and adjust so that entire screen is green. (See Figure 3-1.)
 5. Switch the raster signal to blue, then to red and verify the condition.
 6. When the position of the deflection yoke has been decided, fasten the deflection yoke with the screws.
 7. If the beam does not land correctly in all the corners, use a magnet to adjust it.
(See Figure 3-4.)

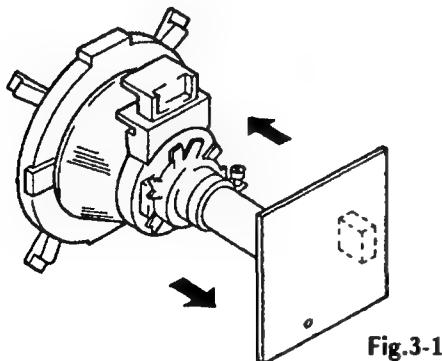

Fig.3-1

Perform the adjustments in order as follows :

1. Beam Landing
 2. Convergence
 3. Focus
 4. White Balance

Note : Test Equipment Required.

Preparation :

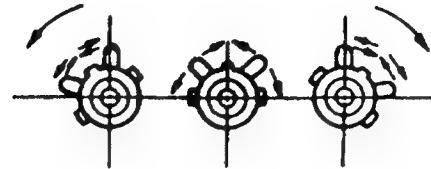

- Before starting this adjustment, adjust the focus, horizontal size, and vertical size.
- Minimize the brightness setting.
- Provide dot pattern.

(1) Horizontal and Vertical Static Convergence

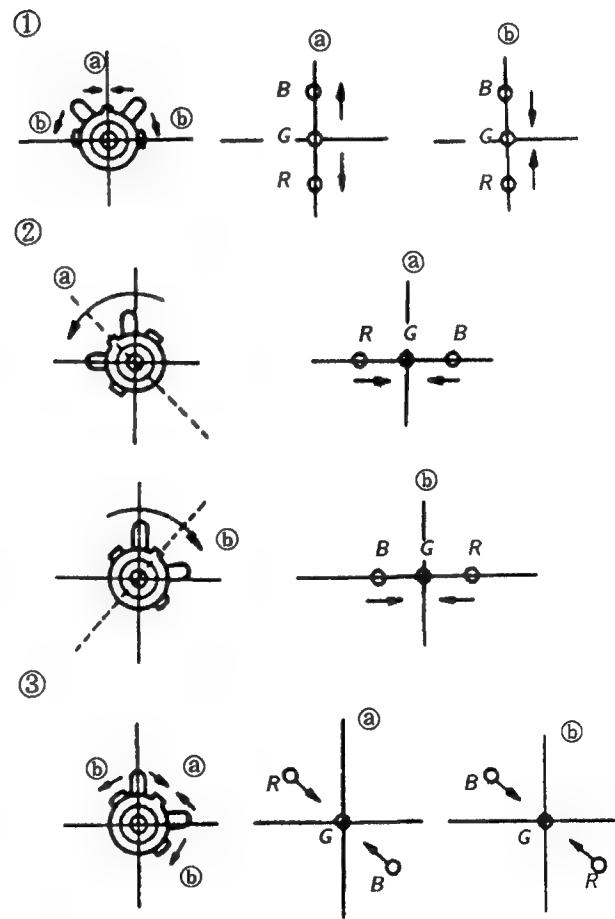

1. (Moving horizontally), adjust the H.STAT control so that the red, green, and blue points are on top of each other at the center of the screen.
2. (Moving vertically), adjust the V.STAT magnet so that the red, green, and blue points are on top of each other at the center of the screen.
3. If the H.STAT variable resistor cannot bring the red, green, and blue points together at the center of the screen, adjust the horizontal convergence with the H.STAT variable resistor and the V. STAT magnet in the manner given below.
(In this case, the H.STAT variable resistor and the V.STAT magnet influence each other)

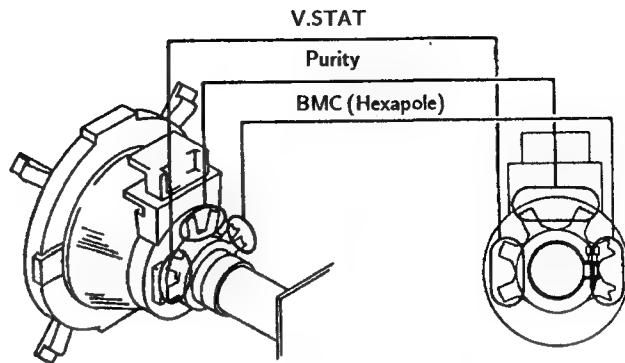

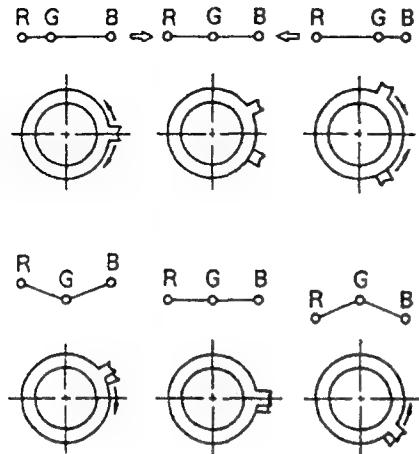

- Tilt the V.STAT magnet and adjust the static convergence by opening or closing the V.STAT magnet.

4. If the V.STAT magnet is moved in the direction of the ① and ② arrows, the red, green, and blue points move as shown below.

- Operation of BMC (Hexapole) Magnet

- The respective dot positions resulting from moving each magnet interact, so be sure to perform adjustment while tracking.

Use the H.STAT VR to adjust the red, green, and blue dots so they coincide at the center of screen (by moving the dots in the horizontal direction).

(2) Dynamic Convergence Adjustment

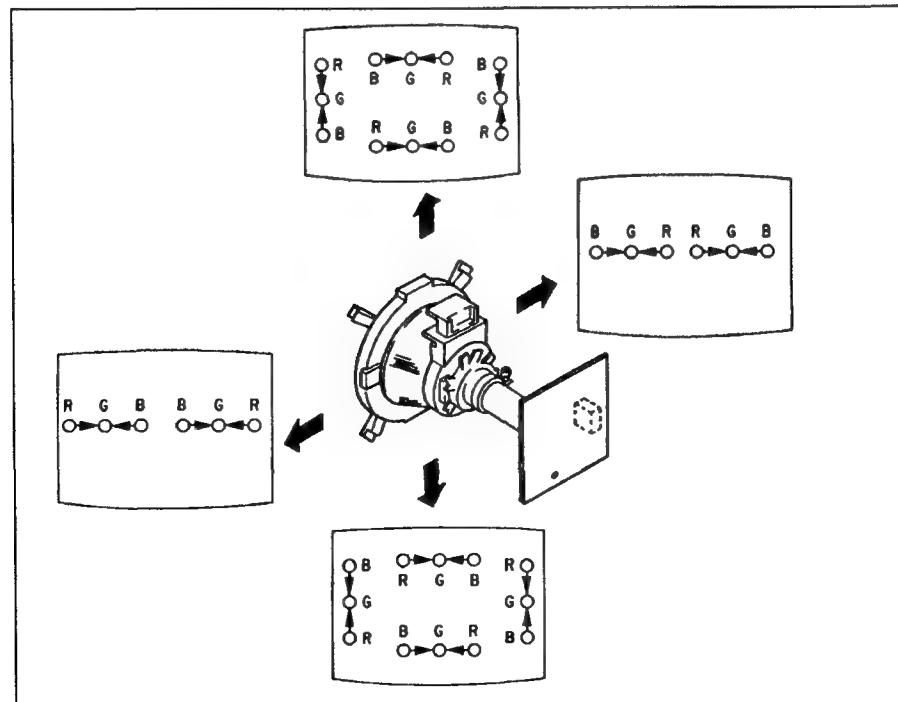

Preparations :

- Before starting this adjustment, adjust the horizontal static convergence and the vertical static convergence.

 - Slightly loosen the deflection yoke screws.
 - Remove the deflection yoke spacer.

SAFETY RELATED ADJUSTMENTS

**☒ R511 CONFIRMATION METHOD (HOLD-DOWN
CONFIRMATION) AND READJUSTMENTS**

The following adjustments should always be performed when replacing the following components (marked with on the schematic diagram).
PM501, R338, R511, R632, R645, R650

1

1. Preparation before confirmation
 - 1) Remove R635 on the D board and connect a variable resistor (RV1: about $4.7\text{k}\Omega$ - $10\text{k}\Omega$) between pin ① of IC601 and B+ line.
 - 2) Supply $130 \pm 2.0\text{V}$ AC to with variable auto-transformer.

2. Hold-down operation confirmation

- 1) Turn the POWER switch ON, and receive entirely white signals and adjust ABL current to $1760 \pm 50\mu\text{A}$ with PICTURE and BRIGHT etc controls.
 - 2) Increase B+ line voltage gradually by adjusting the resistor of RV1. Confirm that the minimum voltage is less than 142.5V DC whereby the raster disappears during operation of hold-down circuit.

NOTE: When the hold-down circuit starts operating, switch OFF the POWER of the set immediately.

- 3) Turn the POWER switch ON, and receive dot signals and adjust ABL current to $160 \pm 50 \mu\text{A}$ with PICTURE and BRIGHT etc controls.
 - 4) Increase B+ line voltage gradually by adjusting the resistor of RV1. Confirm that the minimum voltage is less than 145.0V DC whereby the raster disappears during operation of hold-down circuit.

NOTE: When the hold-down circuit starts operating, switch OFF the POWER of the set immediately.

3. Hold-down readjustment

When step 2 is not satisfied, readjustment should be performed by altering the resistance value of R511 (a component marked with ).

R524 CONFIRMATION METHOD (HOLD-DOWN CONFIRMATION) AND READJUSTMENTS

The following adjustments should always be performed when replacing the following components (marked with on the schematic diagram).
IC601, PM501, D504, C598, R338, R509, R524, R632, R635, R645, T501

2

- 1) Preparation before confirmation
 - 1) Turn the POWER switch ON, and receive entirely white signals and set the PICTURE and BRIGHT controls to maximum.
 - 2) Confirm that voltage of the check terminal of TP-85 (D BOARD) is more than 114.0V DC when the set is operating normally with 120.0 ± 2.0 V AC supply.

2. Hold-down operation confirmation

- 1) Turn the POWER switch ON, and receive entirely white signals and adjust ABL current to $1760 \pm 50 \mu\text{A}$ with PICTURE and BRIGHT etc controls .
 - 2) Apply DC voltage of over 130.0V DC gradually to the check terminal of TP-85 (D BOARD) via 1T40 from the DC stabilized power source. Confirm that the minimum voltage is less than 137.5V DC whereby the raster disappears during operation of hold-down circuit.

NOTE: When the hold-down circuit starts operating, switch OFF the POWER of the set immediately.

- 3) Turn the POWER switch ON, and receive dot signals and adjust ABL current to $160 \pm 50 \mu\text{A}$ with PICTURE and BRIGHT etc controls.
 - 4) Apply DC voltage of over 130.0V gradually to the check terminal of TP-85 (D BOARD) via 1 T40 from the DC stabilized power source. Confirm that the minimum voltage is less than 138.0V DC whereby the raster disappears during operation of hold-down circuit.

NOTE: When the hold-down circuit starts operating, switch OFF the POWER of the set immediately.

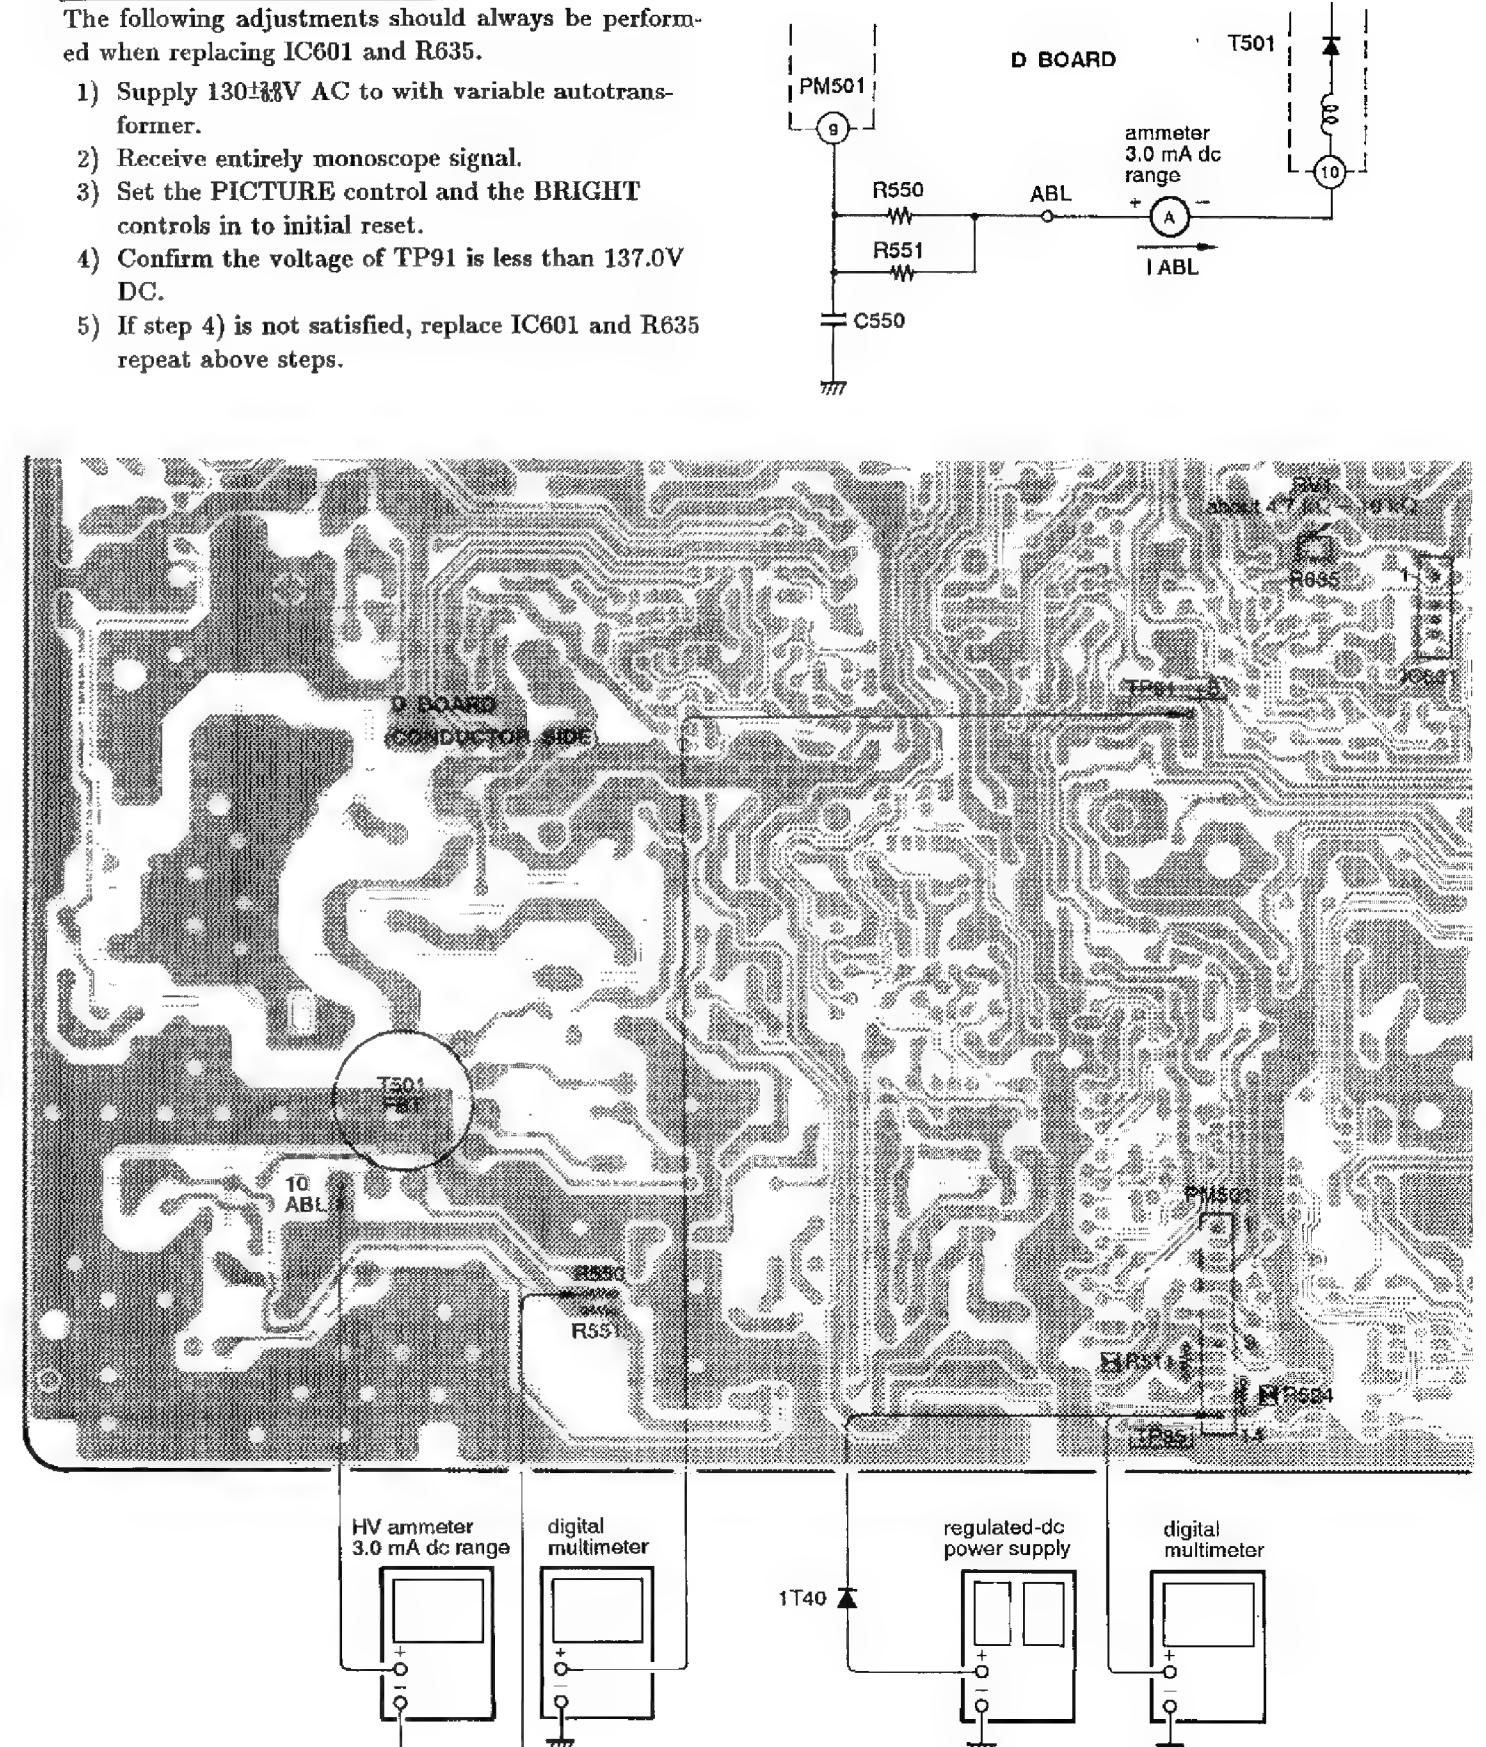

3. Hold-down readjustment

When step 2 is not satisfied, readjustment should be performed by altering the resistance value of R524 (a component marked with ).

B+ VOLTAGE CONFIRMATION

The following adjustments should always be performed when replacing IC601 and R635.

- 1) Supply $130 \pm 10\text{V}$ AC to with variable autotransformer.
 - 2) Receive entirely monoscope signal.
 - 3) Set the PICTURE control and the BRIGHT controls in to initial reset.
 - 4) Confirm the voltage of TP91 is less than 137.0V DC.
 - 5) If step 4) is not satisfied, replace IC601 and R635 repeat above steps.

Replace only with part number:

specified

Les composants identifiés par une trame et une marque sont critiques pour la sécurité. Ne les remplacer que par une pièce portant le numéro spécifique.

- Items marked " * " are not stocked since they are seldom required for routine service. Some delay should be anticipated when ordering these items.
 - All variable and adjustable resistors have characteristic curve B, unless otherwise noted.

RESISTORS

- All resistors are in ohms
 - F : nonflammable

When indicating parts by reference number, please include the board name.

CAPACITORS

COILS

• MMH : mH, UH : μ H

- The components identified by  in this manual have been carefully factory-selected for each set in order to satisfy regulations regarding X-ray radiation. Should replacement be required, replace only with the value originally used.
